#### QUESTION 4

- Overflow is when the number of bits (or data) exceeds the storage capacity of a computer's memory .
- An overflow is handled through taking it (digit )and adding it back to the right most digit (for example if the digit is one , you take it from the front and add it to the last digit (rightmost digit) of your bits)

C)

$$a) \quad 62+47 = 131$$

b)  $457 + 347 = 1026$
